

MeepleNight

A web app for planning board game nights with friends — and remembering who won.

The idea

Friends keep a shared list of board games, plan nights to play them, invite each other, and write down the results. Over time everyone gets their own little stats page and a hint about what to play next.

A typical night, start to finish

1. **Browse the catalogue.** Anyone can look through the games — players, length, category.
2. **Host a night.** A registered user picks a date and place, and shortlists a few candidate games.
3. **Invite friends.** The host sends invitations; guests accept or decline from their inbox.
4. **Play and log it.** Afterwards the host records each game played, the scores, and the winner.
5. **Check the stats.** Wins, plays, and favourites show up on each player's dashboard, with a "play next" suggestion.

Who can do what

Role	Can do
Anonymous	Browse games, view details, register, log in
User	Host nights, invite, RSVP, log sessions, view personal stats
Admin	Everything a user can, plus manage the game catalogue

Under the hood

Web

ASP.NET Core MVC with server-rendered Razor views, Tailwind CSS, and a little Alpine.js.

Data

EF Core 8 over SQL Server LocalDB. Migrations and seed data run on startup.

Accounts

ASP.NET Core Identity with cookie sign-in and role-based access.

Running it

`cd src/MeepleNight.Web` then `dotnet run` — the database is created and seeded automatically, and the app opens on the URL printed in the console.
